

Always power the film off when cleaning and do not power on until 100% dry.

Be careful not to disturb any electrical connections. The best cleaner is a simple solution of water and a small amount of streak free detergent soap. Clean the window and then squeegee dry with overlapping strokes. You may also clean the film surface with any normal strength glass cleaner or isopropyl alcohol and a lint free yellow micro fiber cloth. Our poly vinyl surface is durable however if you could avoid harsh paper towels it would prevent light scratches and hazing over time. Products with ammonia will not damage the film if used in reasonable quantities. **Do not use any abrasive cleaners, industrial strength glass cleaners and/or any other window cleaning tools that may scratch the window film.** Remember, the surface of the film is scratch resistant not scratch proof.

A Clean Working Environment

- The working environment needs to be as clean and dust-free as possible prior to beginning installation. If there is dust in the area or along the surfaces near the glass it can easily contaminate the Smart Tint as it is being applied. For those who are applying the ILLUMI1 Film during a renovation or construction project this is particularly important, as there is often debris in the air.
- If there is dust or debris in the air or you just want to take an extra precaution you can spray water mist into the air an hour or so prior to beginning the installation. This will help remove particulate matter from the air.
- ILLUMI1 Film uses AB Glue Self Adhesive backing
